Demo website (Visual description of our project): https://rujter.github.io/Innovative_AllnighterEF/

We're not asking healthcare professionals to change how they work, we are eliminating unnecessary steps from the way they already work

How Our Ideas Make Work Easier for Medical Personnel:

- Centralized Patient Passport gives immediate access to medications, interactions, allergies, and history, downtime between exams and eliminating multi-database searches
- One-click approvals for routine administrative requests and digital prescriptions
- Incoming requests are categorized into administrative, non-urgent and urgent medical cases
- Implementation of a custom templates for repetitive administrative tasks

How Our Ideas Make Healthcare Easier for Patients:

- Automated renewals and scheduling for chronic care eliminate calls
- Cancelled slots are automatically offered to the next patient on the waiting list
- Omaolo-style decision trees guide patients to appropriate care, auto-forwarding symptom briefs to doctors to speed up consultations and reduce calls.
- Urine and stool sample containers and delivered and sent by post, reducing lab visits
- Authorized caregivers can manage appointments for elderly or digitally inexperienced patients.

Financial cost:

Base cost and ZVEM integration	**900k (Effort calculation using UCP)**
Initial GDPR compliance, accreditation and testing	**500k (Class IIa SaMD, IEC 27001, DPIA, ISO 13485)**
Symptom triage engine and research	**500k**
Yearly run cost	**400k/yr (Developers, Maintenance, Audits)**
Contingency	**at 15% = 345k first year, 60k years followed**

Labor analsys:

Nurse/doctor min saved per day	**Conservative ~30/20min as per NHS study**
Nurse/Doctor time freed per day	**Avg ~3k/1k x 30/20min/day = 1500/600h/day**

Considering the 600h/day freed and an average appointment length of 20min as per an NHS study the primary GP doctors save the equivalent of examining an extra 1800 patients/day!
